

# SMS Klima

Design and implementation of software for service management and installation assembly.

## Workshops:

1

Developed software for efficient air conditioning service and assembly management.

2

Created a B2B system to improve order distribution and service response.

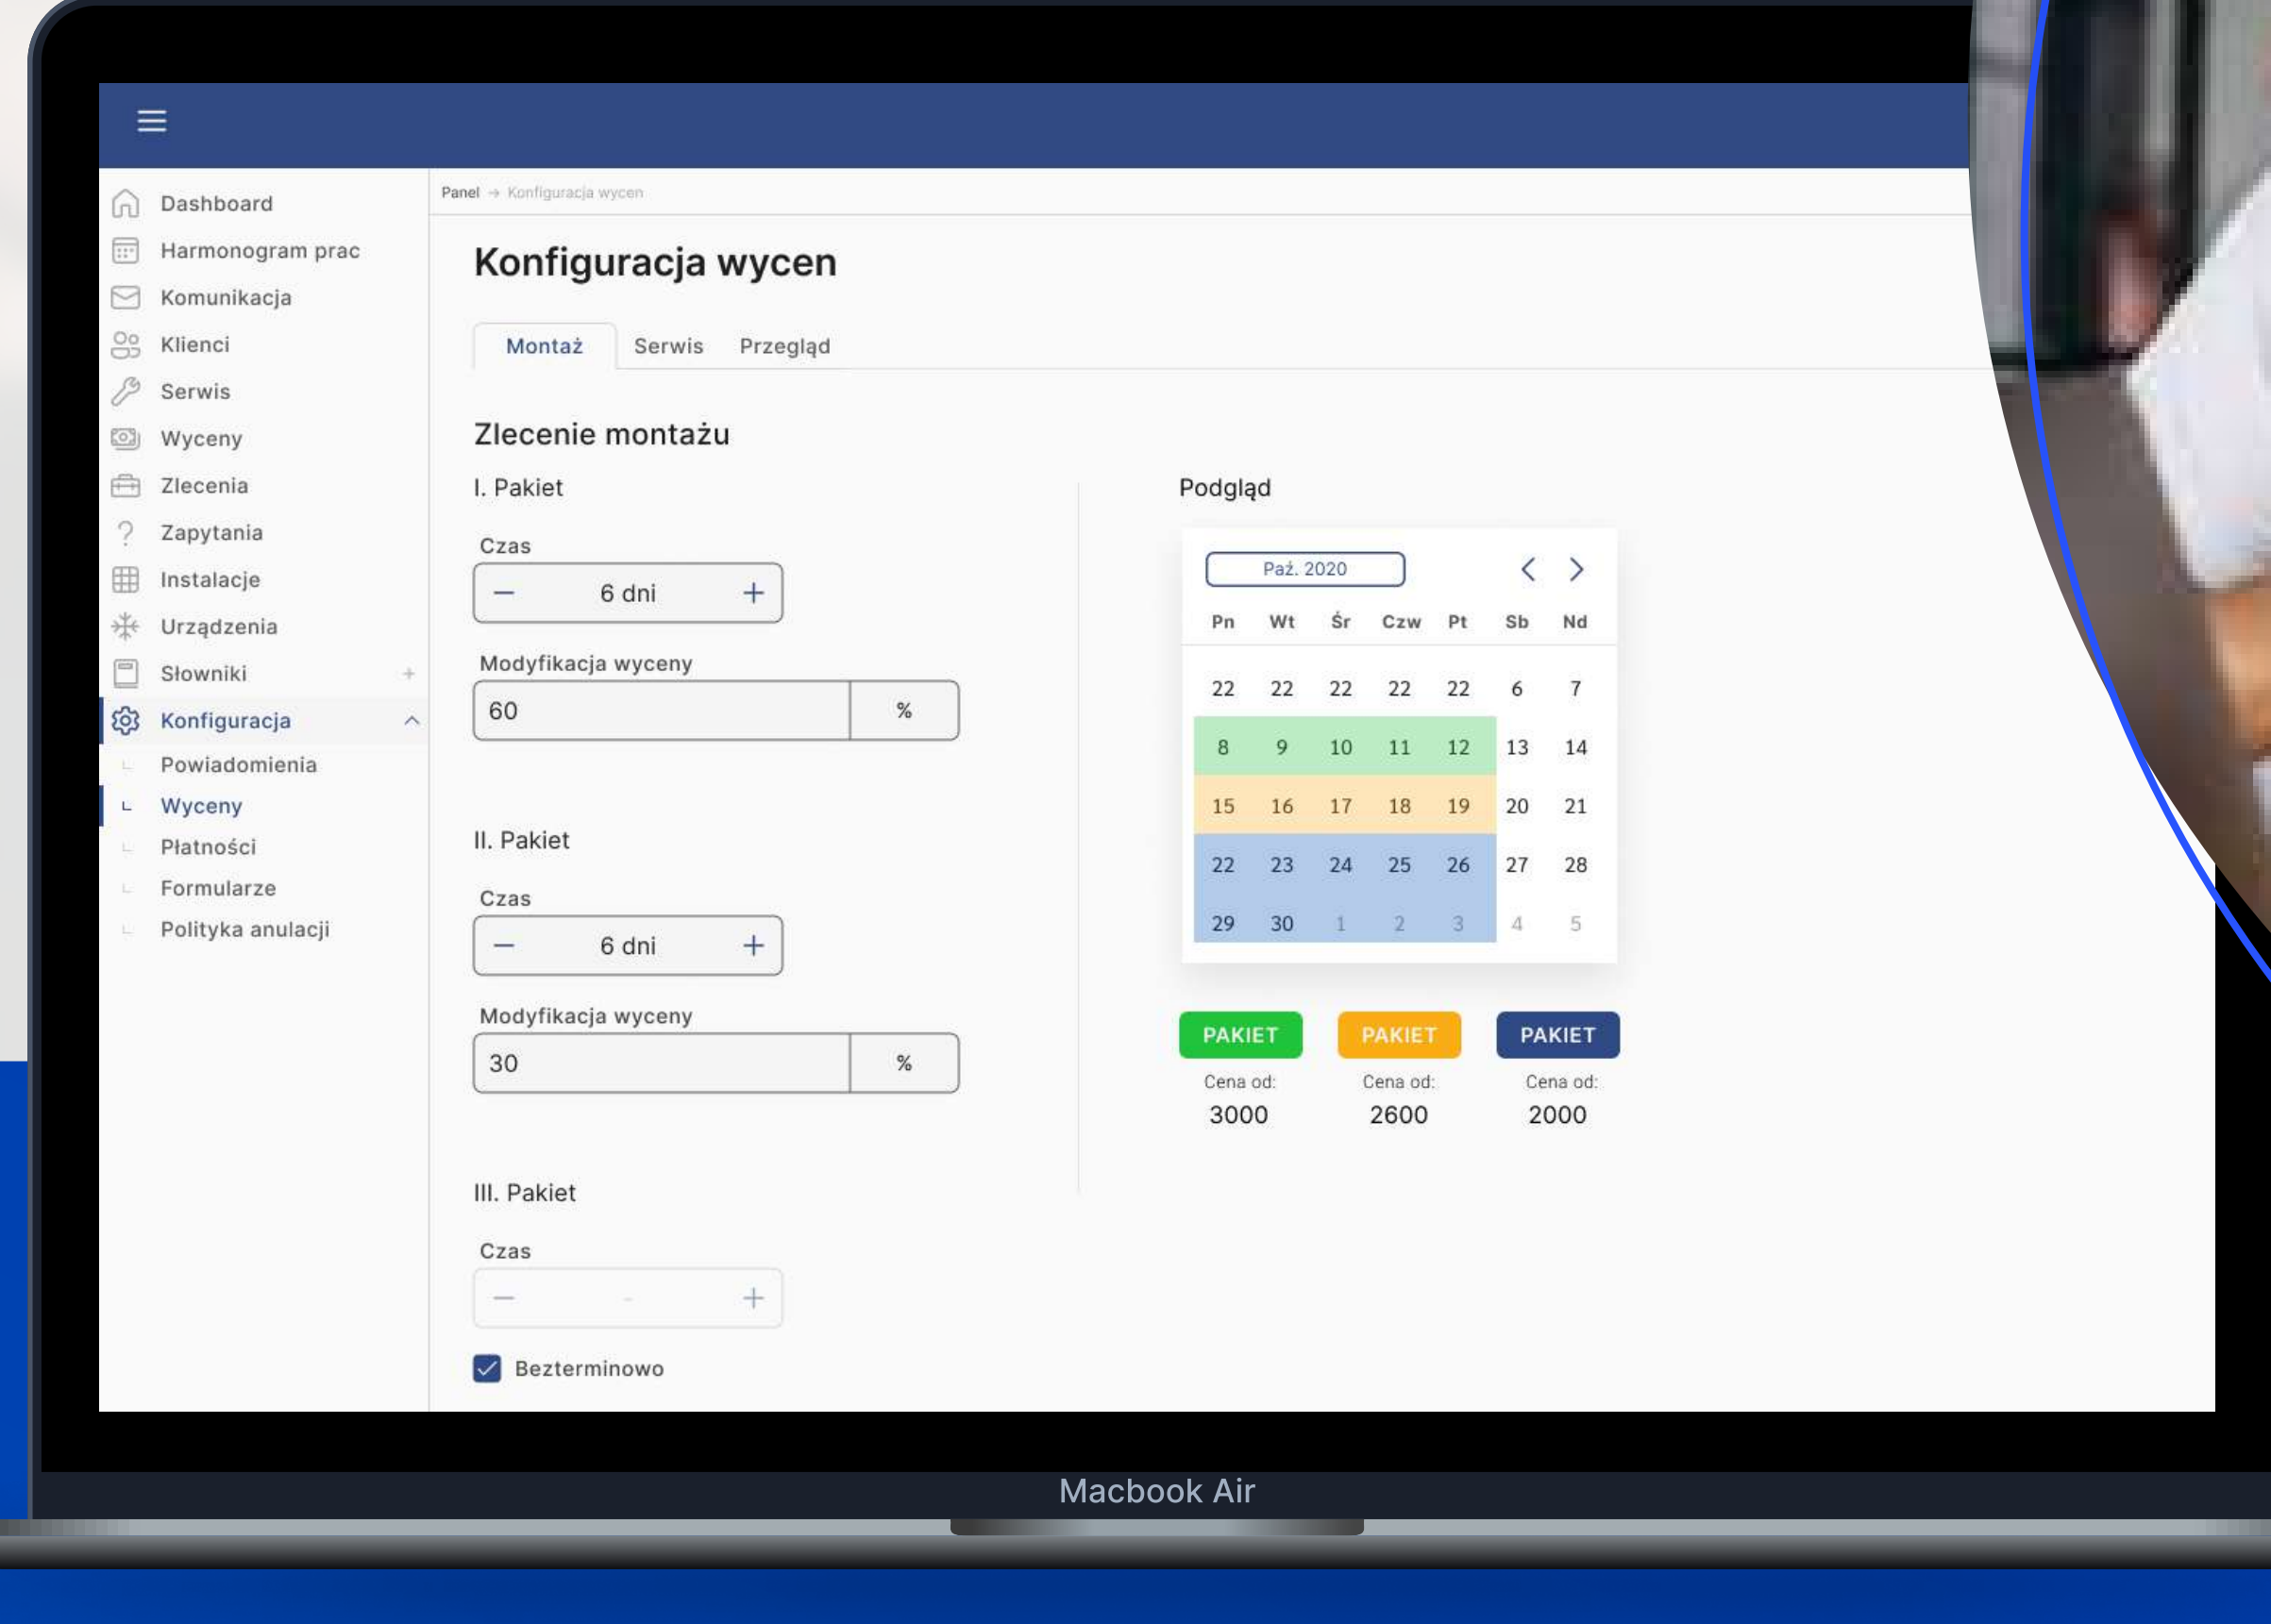

3

Designed mobile apps for seamless cooperation and communication.

## Designs

We created software for managing air conditioning service and assembly. The application allows clients to create orders, and operators can assign orders to partners, optimizing service response time.

We designed an intuitive schedule to support service planning, along with B2B and mobile client applications for smoother communication.

## Mockup

During the mockup phase, we transformed our design concepts into tangible representations using Figma, collaborating closely with the client to create user stories and wireframes.

This step allowed us to better understand complex systems, organize information effectively, and present data legibly.

## Testing

We ensured rigorous testing and validation, focusing on flawless functionality, responsiveness, and efficient data synchronization between components.

## Coding

The development phase utilized the 300DEVS Angular CDK for creating front-end components based on Google Material design patterns.

It included NGRX for managing application state, reducing code repetition, and facilitating rapid implementation.

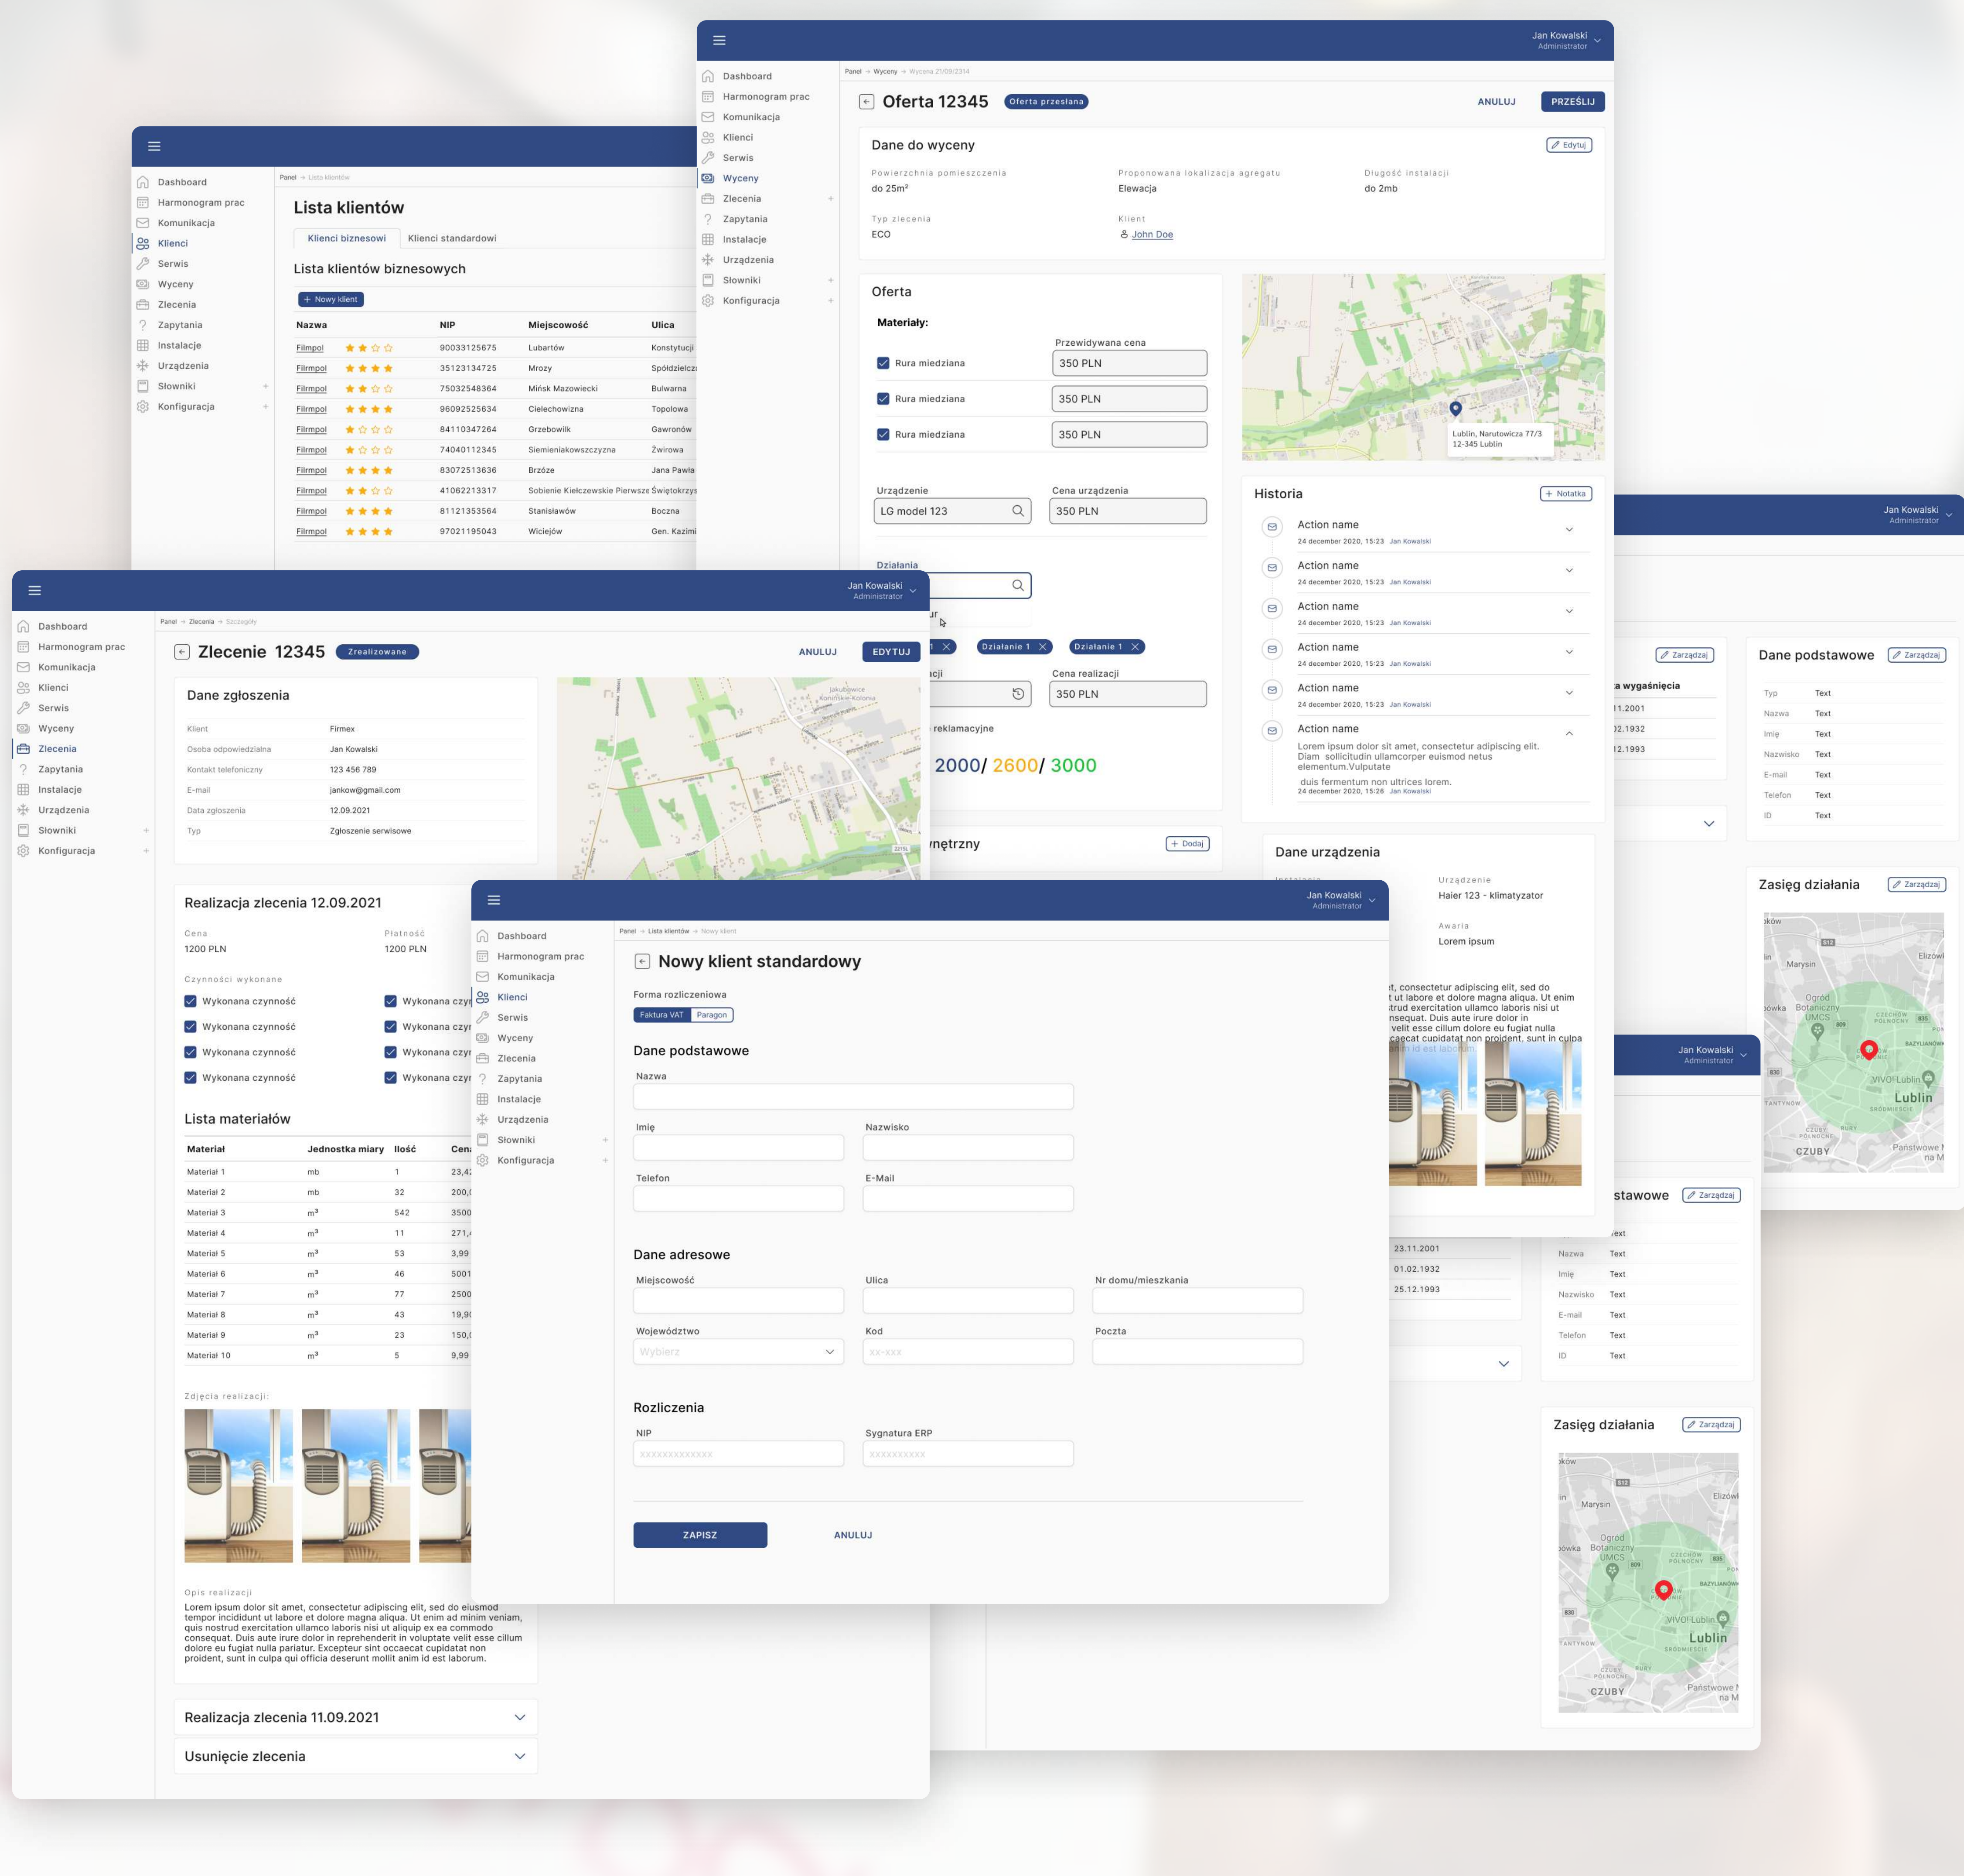

## Results

The project delivered a comprehensive solution for managing air conditioning service and assembly, streamlining operations, enhancing communication, and improving service response times.

Our design and coding efforts have led to an intuitive and efficient system that meets the client's needs.

Our achievements highlight our commitment to creating the perfect solution for you. Contact us to discuss tailoring an application to your specific needs.

Let's talk about your project!
